

PEPUP: Volume Based Feeding Calculations

If the dietitian has not yet assessed the patient on day 2, when volume-based feedings are ordered by a physician, use a weight-based target volume until the dietitian assesses the patient:

Weight	Peptamen® Intense VHP 24-hour target volume with a 1.0 cal/mL feeding	Peptamen AF® 24-hour target volume with a 1.2 cal/mL feeding	Peptamen® 1.5 or Peptamen® 1.5 with Prebio ^{1TM} 24-hour target volume with a 1.5 cal/mL feeding
≤50 kg	1050 mL/24 hrs	875 mL/24 hrs	700 mL/24 hrs
50.1-65 kg	1350 mL/24 hrs	1125 mL/24 hrs	900 mL/24 hrs
65.1-80 kg	1650 mL/24 hrs	1375 mL/24 hrs	1100 mL/24 hrs
80.1-95 kg	1950 mL/24 hrs	1625 mL/24 hrs	1300 mL/24 hrs
≥95.1 kg	2400 mL/24 hrs	2000 mL/24 hrs	1600 mL/24 hrs

How to use the table:

1. Calculate the feeding goal for the volume based enteral feeding for the patient for a 24 hour period (i.e, 7 am to 7 am each day)
2. Read the chart below corresponding to the 24 hour feeding goal for the patient. For example, if the total volume over a 24 hour period was 1800 mL, the first column will give the hourly feeding rate for the patient (in this instance 75 ml/hr)
3. If the patient was already fed 450 mL (over a 6 hr period at the rate of 75mL/hr) and the patient is on 'hold' for 5 hours, calculate the following:

(a) New Feeding Goal = Volume still remaining to attain the feeding goal

= Total Goal Volume - Already fed Volume

= 1800-450=1350mL (Round the volume, if needed, to the closest 50 mL)

(b) Time remaining to attain goal = 24 - Time Fed - Hold Time

= 24-6-5= 13hrs

4. Now read the chart again with the New Feeding Goal and the corresponding time remaining as follows:

For 1350 mL, go to column 13 (the number of hours remaining to attain goal) to get the new hourly feeding rate. In this instance, the new feeding rate is 104 mL/hr.*

The patient will receive 1352 mL in 13 hours.

Important Nursing Assessment

Volume based feeding should be used with caution. Nurses should always assess for feeding intolerance. Examples of intolerance include: abdominal distention, abdominal cramping, nausea & vomiting, diarrhea defined as 5 stools or 750 mL per 24 hour period, and gastric residuals greater than 300 mL**.

* Hourly reate not to exceed 150 mL/hr.

**Sites may customize the gastric residual volume threshold in keeping with their current practice and best available evidence which supports a gastric residual volume between 250 – 500 mL. Source: 2013 Canadian Clinical Practice Guidelines www.criticalcarenutrition.com, 2009 ASPEN/SCCM Guidelines.

Please note: These are suggested guidelines for enteral feeding based on Enhanced Protein-Energy Provision via the Enteral Route in Critically Ill Patients (PEP uP) Protocol. They are not intended as a substitute for medical advicetheir current practice and best available evidence

Please contact your ICU dietitian if you have any questions
