2

Objectives

- To understand the quality of evidence in the literature supporting early enteral feeding in critical illness.
- To learn the clinical impact from loss of gut barrier defenses, immune dysregulation, and progression from a commensal microbiome to a virulent pathobiome.
- To appreciate new ways by which nutritional therapy can support the intestinal microbiome and promote a clinical pattern of recovery in an ICU setting.

3

Chaos in Critical Care Nutrition: How Important is Nutritional Rx?

PN

EN

"Recent large RCTs have not generated evidence that providing nutrition early in critical illness results in clinical benefits"

MP Casaer, G Van den Bergh (NEJM 2014;370:1227)

4

Weakness in Scientific Method

Why Most Published Research Findings Are False

John A. Ioannidis

Truth of research findings related to its reproducibility by subsequent research trials or its Positive Predictive Value (PPV)

JPA Ioannidis [PLoS Medicine 2005;2(8):e124]

5

How Do We Trust Research Results?

- Large well-designed RCTs, appropriate meta-analyses of sound RCTs have highest PPV
10% of large RCTs will be discounted by subsequent trials
33% of good quality meta-analyses will be reversed
- Observational studies suffer from potential for confounding factors
85% will be discounted by future studies
- Principles of clinical practice derived from all scientific information available
No study totally reliable at exclusion of all others
Incorporate findings if methodology sound, results plausible, supported by physiology

JPA Ioannidis [PLoS Medicine 2005;2(8):e124]

6

Documenting the Benefit of Nutritional Therapy

Recent large studies show no difference trophic vs full feeds, EN vs PN
Mortality of ARDSNet Controls has decreased 70% → < 20% over 30 yrs
As critical care improves, harder to tease out influence of each Rx modality

MJ Noto, AP Wheeler (Amer J Respir Crit Care Med 2013;188:128) Garches (Lancet Respir Med 2015)

7

Nutrition Therapy Does Change Outcome

Early EN vs No Early EN (p=0.01)

Infection 51.7%→36.3%, p=0.03

Controls: Intentional delay
Do nothing (STD)

Early EN vs No Early EN (p=0.05)

Mortality 14.1%→8.7%, p=0.05

SA McClave, BE Taylor (JPEN 2016;40:199-211)

8

Balance Between Physiologic States

Commensal Refaunation

Bloom of Pathobionts

Pattern of Recovery: Barrier Function, Symbiosis, Homeostasis

Pattern of Gut Sepsis: Permeability, Dysbiosis, Immune Dysregulation

9

Gut Responses to Critical Illness

Alterations in Barrier Function

Commensal Signaling

Autodigestion

Loss function (mucus, tight junctions, defensins)
Proinflammatory signaling (gut sepsis)
Penetration of pancreatic enzymes (MOF)
Emergence of virulent pathobiome

Toxic Lymph MOF

MA Krezalek, JC Alverdy (Shock 2016;45:475) M Hayakawa (Dig Dis Sci 2011;56:2361)

10

Progression from Microbiome to Pathobiome

Commensal Microbes

Pathobionts

Disappearance of commensals, loss of biodiversity
Emergence of virulent pathobiome
Infectious morbidity, antibiotic resistance, anastomotic dehiscence

MA Krezalek, JC Alverdy (Shock 2016;45:475) M Hayakawa (Dig Dis Sci 2011;56:2361)

11

Calculating Nutritional Risk Gives Management Direction

Nutrition risk – Two Aspects
Disease severity
Nutritional status

Why assess nutrition risk?
Prognostic - Tolerance, difficulty Rx
May predict need to goal, benefit of Rx
Impact urgency, dose, need for supp PN

Age >70 yrs : Add 1 point

Score ≥3 Consider EN/PN
Score ≥5 High risk

1 J Kondrup (Clin Nutr 2002) 2 B Hu (Crit Care 2017;21:188)

12

Is Trophic Underfeeding Effective ?

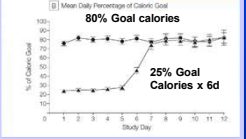

Eden Omega Trial ALI/ARDS patients on MV¹
Trophic 20cc/hr (n=508) vs Full feeds (n=492)
No difference: Mortality, vent-free days, MOF, infection

PERMIT Trial Permissive Underfeeding in Mix ICU²
Underfeed 46% (n=894) vs Full feed 71% (n=446)
No difference: Infection, ICU LOS, ICU/Hosp mortality

¹ TW Rice (JAMA 2012;307:795) ² YM Arabi (NEJM 2015;372:2398)

ONLINE FIRST
Initial Trophic vs Full Enteral Feeding in Patients With Acute Lung Injury: The EDEN Randomized Trial

Goal: No primary outcomes
Objective: To determine whether trophic feeding is superior to full feeding in patients with acute lung injury.

13

Value of EN Due to Physiologic Response

Critical Care Medicine

Mechanistic Data

Non-Nutritional:
Trophic dose EN may be OK
Nutritional:
Probably need full dose EN

- Non-Nutrition benefits** – Seen in all patients
 - Gastrointestinal responses**
 - Trophic on gut integrity
 - Gut/lung axis of inflamm
 - Reduced bact virulence
 - Immune responses**
 - Modulate regulatory cells
 - Maintain MALT tissue
 - Metabolic responses**
 - Incretin to ↑ insulin sens
 - Reduce hyperglycemia (AGES)
- Nutrition benefits** – Seen in high risk patients
 - Protein, calories
 - Maintain LBM
 - Micronutrients, anti-oxidants
 - Stimulate protein synthesis

S McClave, R Martindale, T Rice, D Heyland (CCM 2014;42:2600)

14

Nutritrea-2 Trial: Impact of Aggressive EN

Enteral versus parenteral early nutrition in ventilated adults with shock: a randomised, controlled, multicentre, open-label, parallel-group study (NUTRREA-2)

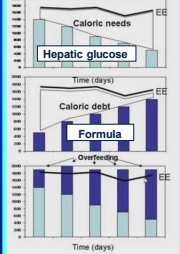

Third largest PRCT in clinical nutrition (n=2400)
EN vs PN in MICU adults on MV in septic shock
Elderly (63 yrs), ICU LOS (9-10 days), high mortality rate (35%)
Groups got same calories (18-19 kcal/kg/d), protein (0.7-0.8 g/kg/d)
Key issue - EN start w/in 24 hrs of MV, advance to goal w/in 24 hrs
Differences minimized by short duration of Rx in EN (6 days EN)
Crossover of PN group to EN after 3 days (aver 4 days PN)

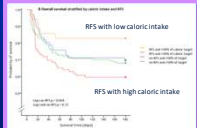

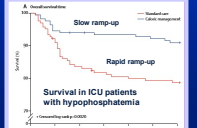

Results: No difference in outcomes
Bowel ischemia in 19 EN pts vs 5 PN pts (p<0.05) J Reigner (Lancet 2018;391:133)

15

Five Reasons for Slow Ramp-up Over First Week

- Risk of bowel ischemia in pts with hemodynamic instability¹
- Overfeeding in ICU pts can occur when formula is added to hepatic endogenous glucose production²
- Risk of refeeding syndrome in pts with hypophosphatemia³
- Underfeeding supports Autophagy
- Gauge tolerance as rate of infusion increased

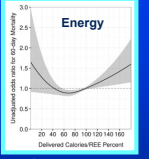

¹ J Reigner (Lancet 2018;391:133)
² V Fraipont, JC Prieser (JPEN 2016;37:705-13)
³ GS Dalg (Lancet Respir Med 2015; 3: 943-52) 15

16

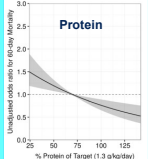

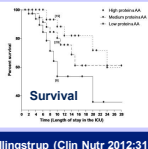

Pushing Protein: From Sarcopenia to Anabolic Resistance and Exercise

Reaching protein goals >> energy goals
Pushing dose to higher range 1.2-2.0 gm/kg/day

Important concept or jumping on a bandwagon?

MJ Allingstrup (Clin Nutr 2012;31:462)
Zusman (Crit Care 2016;20:367)

17

Pushing Protein

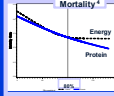

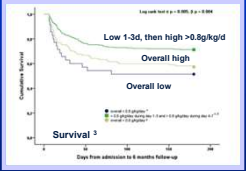

Is there a ceiling on protein incorporation into muscle?

Anabolic resistance¹

Splanchnic sequestration of AAs
Availability of AAs to muscle, other organs
Blunted anabolic response to AA provision
Worsened by insulin resistance, inflammation, critical illness, age, # satellite cells, disuse
↑ Protein may overcome anabolic resistance

Elderly particularly susceptible:²

- ↑ Baseline loss musc mass
- ↓ Recovery musc fxn after disuse
- ↑ Anabolic resistance to AA
- ↑ Levels of protein needed for pos NB

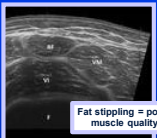

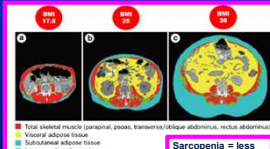

¹Shad (AmJPhysEndocrMetab 2016;311:E803) ²Dickerson (JPEN 2015;39:759) ³Koekkoek (ClinNutr 2018) ⁴M Nicolò (JPEN 2016;40:45)

18

Pushing Protein

- Protein doses high enough? Intermittent > continuous?
- Importance of exercise - Start early in critical illness
 - Time exercise with protein provision
- Adjust for level of function
 - Awake alert – Safe ambulation
 - Debililitated - Time in chair, passive range-of-motion exercises
 - Altered MS, shock - Continuous passive motion (CPM) device
 - Neuromuscular electrical stimulation (NIMES)
- What lessons can we learn from body builders?
 - BCAAs, HMB, Vit D, creatine, ALA, fish oil

Wischmeyer (Crit Care 2017;21:316) Hanna (JPEN 2015;39:273)

19

Should We Provide Micronutrient Supplements?

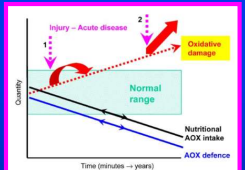

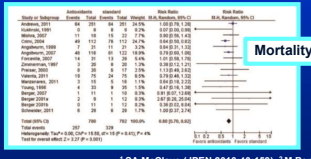

Where there is smoke, there may be fire....

Three schools of thought: Measure levels, correct deficiencies
Empirically provide physiologic doses
Provide supraphysiologic doses

20

Micronutrient Supplementation

Mortality¹

Mortality²

ASPEN/SCCM: Empiric Rx¹
ESPEN Crit Care: Empiric Rx, Measure Vit D²
CCPGs: Do not rec Empiric Rx (2015 reversed 2013 rec)³

¹SA McCleave (JPEN 2016;40:189) ²M Berger (Clin Nutr online Jul 20, 2018 ESPEN 2018 Crit Care Guidelines)³ D Heyland (criticalcarenutrition.com Dec 2016) ⁴M Berger (Clin Nutr 2005;24:172)

21

Should PN be Used More in the Hospital Setting?

Trial of the Route of Early Nutritional Support in Critically Ill Adults

External versus parenteral early nutrition in ventilated adults with shock - a randomised, controlled, multicentre, open-label, parallel-group study (NUTRISOCK-2)

- CALORIES Trial¹ EN vs PN x 5 days in 2400 mixed ICU pts (80% goal feeds)
 - No difference in outcomes
- NUTRISOCK-2 Trial² EN vs PN x 5-6 days in 2410 MICU pts in septic shock
 - No difference in outcomes
- Impact: Under controlled conditions, high risk patients, PN can = EN
 - EN still preferred over PN, but should lower threshold to use PN

¹SE Harvey (NEJM 2014; 371(18):1673) ²J Reigner (Lancet 2017 Nov Online)

22

Initiation of PN

SCCM ASPEN ESPEN Critical Care Nutrition

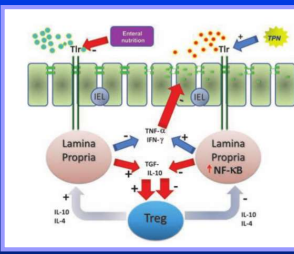

- SCCM/ASPEN 2016:**
 - Exclusive PN (Low Risk) – Withhold PN over first week
 - Exclusive PN (High Risk) – Initiate PN ASAP
 - Supplemental PN – Withhold supp PN for 7-10 days (all pts)
- Canadian CPGs 2015:**
 - Exclusive PN (Low Risk) – Do not recommend PN
 - Exclusive PN (High Risk) – Consider PN esp if malnourished
 - Supplemental PN – Do not use in unselected patients
- ESPEN 2018:**
 - Exclusive PN – Use delayed PN after 3-7 days if EN not feasible
 - Use early low dose PN in malnourished pts EN not feasible
 - Supplemental PN – Use case-by-case first week if EN < full dose

Comment: Insufficient EN defined <60% goal requirements

23

Does Current Nutritional Rx Support the Microbiome?

- EN less inflammation than PN^{1,2}
 - Both result in relative nutrient deprivation
- Blenderized whole food formula vs polymeric (Mouse model)³
 - Reduced systemic inflammation (IL-6 levels)
 - Greater biodiversity
 - ↓Enterobacteriaceae, ↑Commensals
 - ↑Beneficial anti-inflamm (orgs) compounds
- Strategies to promote commensalism^{4,5}
 - Judicious Abx, opioids, serum bovine IgG
 - Soluble fiber, PEG-phosphate
 - Fecal microbial transplant (FMT)

¹Feng, Teitelbaum (Ann NY Acad Sci 2012;1258:71) ²Ralls, Teitelbaum (Surg 2015;157:732) ³Yeh, Morowitz (ASPEN CNW 2018 Abstr #2832646) ⁴Morowitz (Surg Clin N Amer 2011;91:711) ⁵Alverdy (Curr Opin Clin Nutr Metab Care 2005;8:205)

24

Rationale for FMT in ICU

- Clinical Impact**
Lose 90% commensals in 6 hrs, loss of biodiversity, emergence of virulent pathobiome
Antibiotic resistant orgs, sepsis, anastomotic dehiscence, toxic lymph, MOF

Krezalek, Alverdy (Shock 2016;45:475) Morowitz, Alverdy (Ann Surg 2011; 253:1094)
Zaborin, Alverdy (Am J Phys Gastroint Liver Physiol 2017;312:G112)

25

FMT in ICU

- Delivery issues**¹
Cecum > rectum 90 vs 63%
Southern > Northern route (86 vs 74%)
Second > first FMT (83 vs 62%)
- Commercial products from fully vetted donors**²
Stool studies (C+S, O+P, C Diff, VRE, MRSA, norovirus)
Serology (HIV, RPR, Hep A/B/C, CMV, EBV)
Clinical (no Abx, incarceration, illicit drugs, tattoos)
- Lyophilized powder vs sterile fecal filtrate transfer (FFT)**³
Bacterial components, bacterial phages, no live orgs
Fresh/frozen vs lyophilized powder (83-100% vs 73-78%)

¹ZD Jiang (Aliment Pharm Ther 2017;45:899) ²CR Kelly (Gastro 2015;149:223) ³PK Tosh (Clin Infect Dis 2012;54:707)

26

Experience with FMT in the ICU

Patient	Presentation	Concomitant Rx	FMT	Recovery
36 y.o. Female ¹	Trauma, TBI, intractable diarrhea, AAA enterocolitis	Dexamethasone Antibiotics Probiotics	Day 72 Donor feces (Mother) ↓ Fever ↓ Diarrhea Grat infusion	2 Days
29 y.o. Female ¹	SIRS, intractable diarrhea, septic shock (NID UC, colectomy)	Antibiotics Probiotics	Day 20 Donor feces per NG tube ↓ Fever ↓ Diarrhea	1 Day
44 y.o. Female ¹	Septic shock, intractable diarrhea, v/p partial gastrectomy/vagotomy	Antibiotics Probiotics ECMO, CRRT	Day 30 Donor feces (Brother) per NG tube ↓ Septic ↓ Diarrhea	2 Days
65 y.o. Male ²	Cerebral hemorrhage, MODS, septic shock, intractable diarrhea	Antibiotics	Day 20 Donor feces (Grad student) Sterile-filtered pathogen-free feces per NG tube ↓ Fever ↓ Diarrhea	1 Day
84 y.o. Male ²	Cerebral infarct, MODS, septic shock, intractable diarrhea	Antibiotics Probiotics	Day 7 Donor feces (Grad student) Sterile-filtered pathogen-free feces per NG tube ↓ Fever ↓ Diarrhea	1 Day

SA McClave (Curr Opin Crit Care 2018) Q Li (Crit Care 2015 ;19:37) (Am J Gastro 2014;109:1832)

27

Phases of Critical Illness

Phases: Acute, Post-Acute, Recovery

Acute: Trophic Feeds, Nutritional Support

Post-Acute: Advance to Goal, Start exclusive PN (if EN not feasible (high risk))

Recovery: Add Supp PN (EN Insufficient), Replete deficits, Maximize muscle mass, ftn

ICU admission, Days since ICU admission, Assess risk, tolerance, resuscitation, refeeding
